

Space Mission Visualizer

Space Apps Challenge

SPACE ADVENTURE: FROM THE EARTH TO THE LIMITS OF THE SOLAR SYSTEM

Idea

- Overview of Current Space Missions in Earth Orbit
- Zoomable 3D Environment
- Modern Web Application without the need for plugins

International
Space Station

Envisat

Tiangong-1

Solar Dynamics
Observatory

INTErnational
Gamma-Ray
Astrophysics
Laboratory

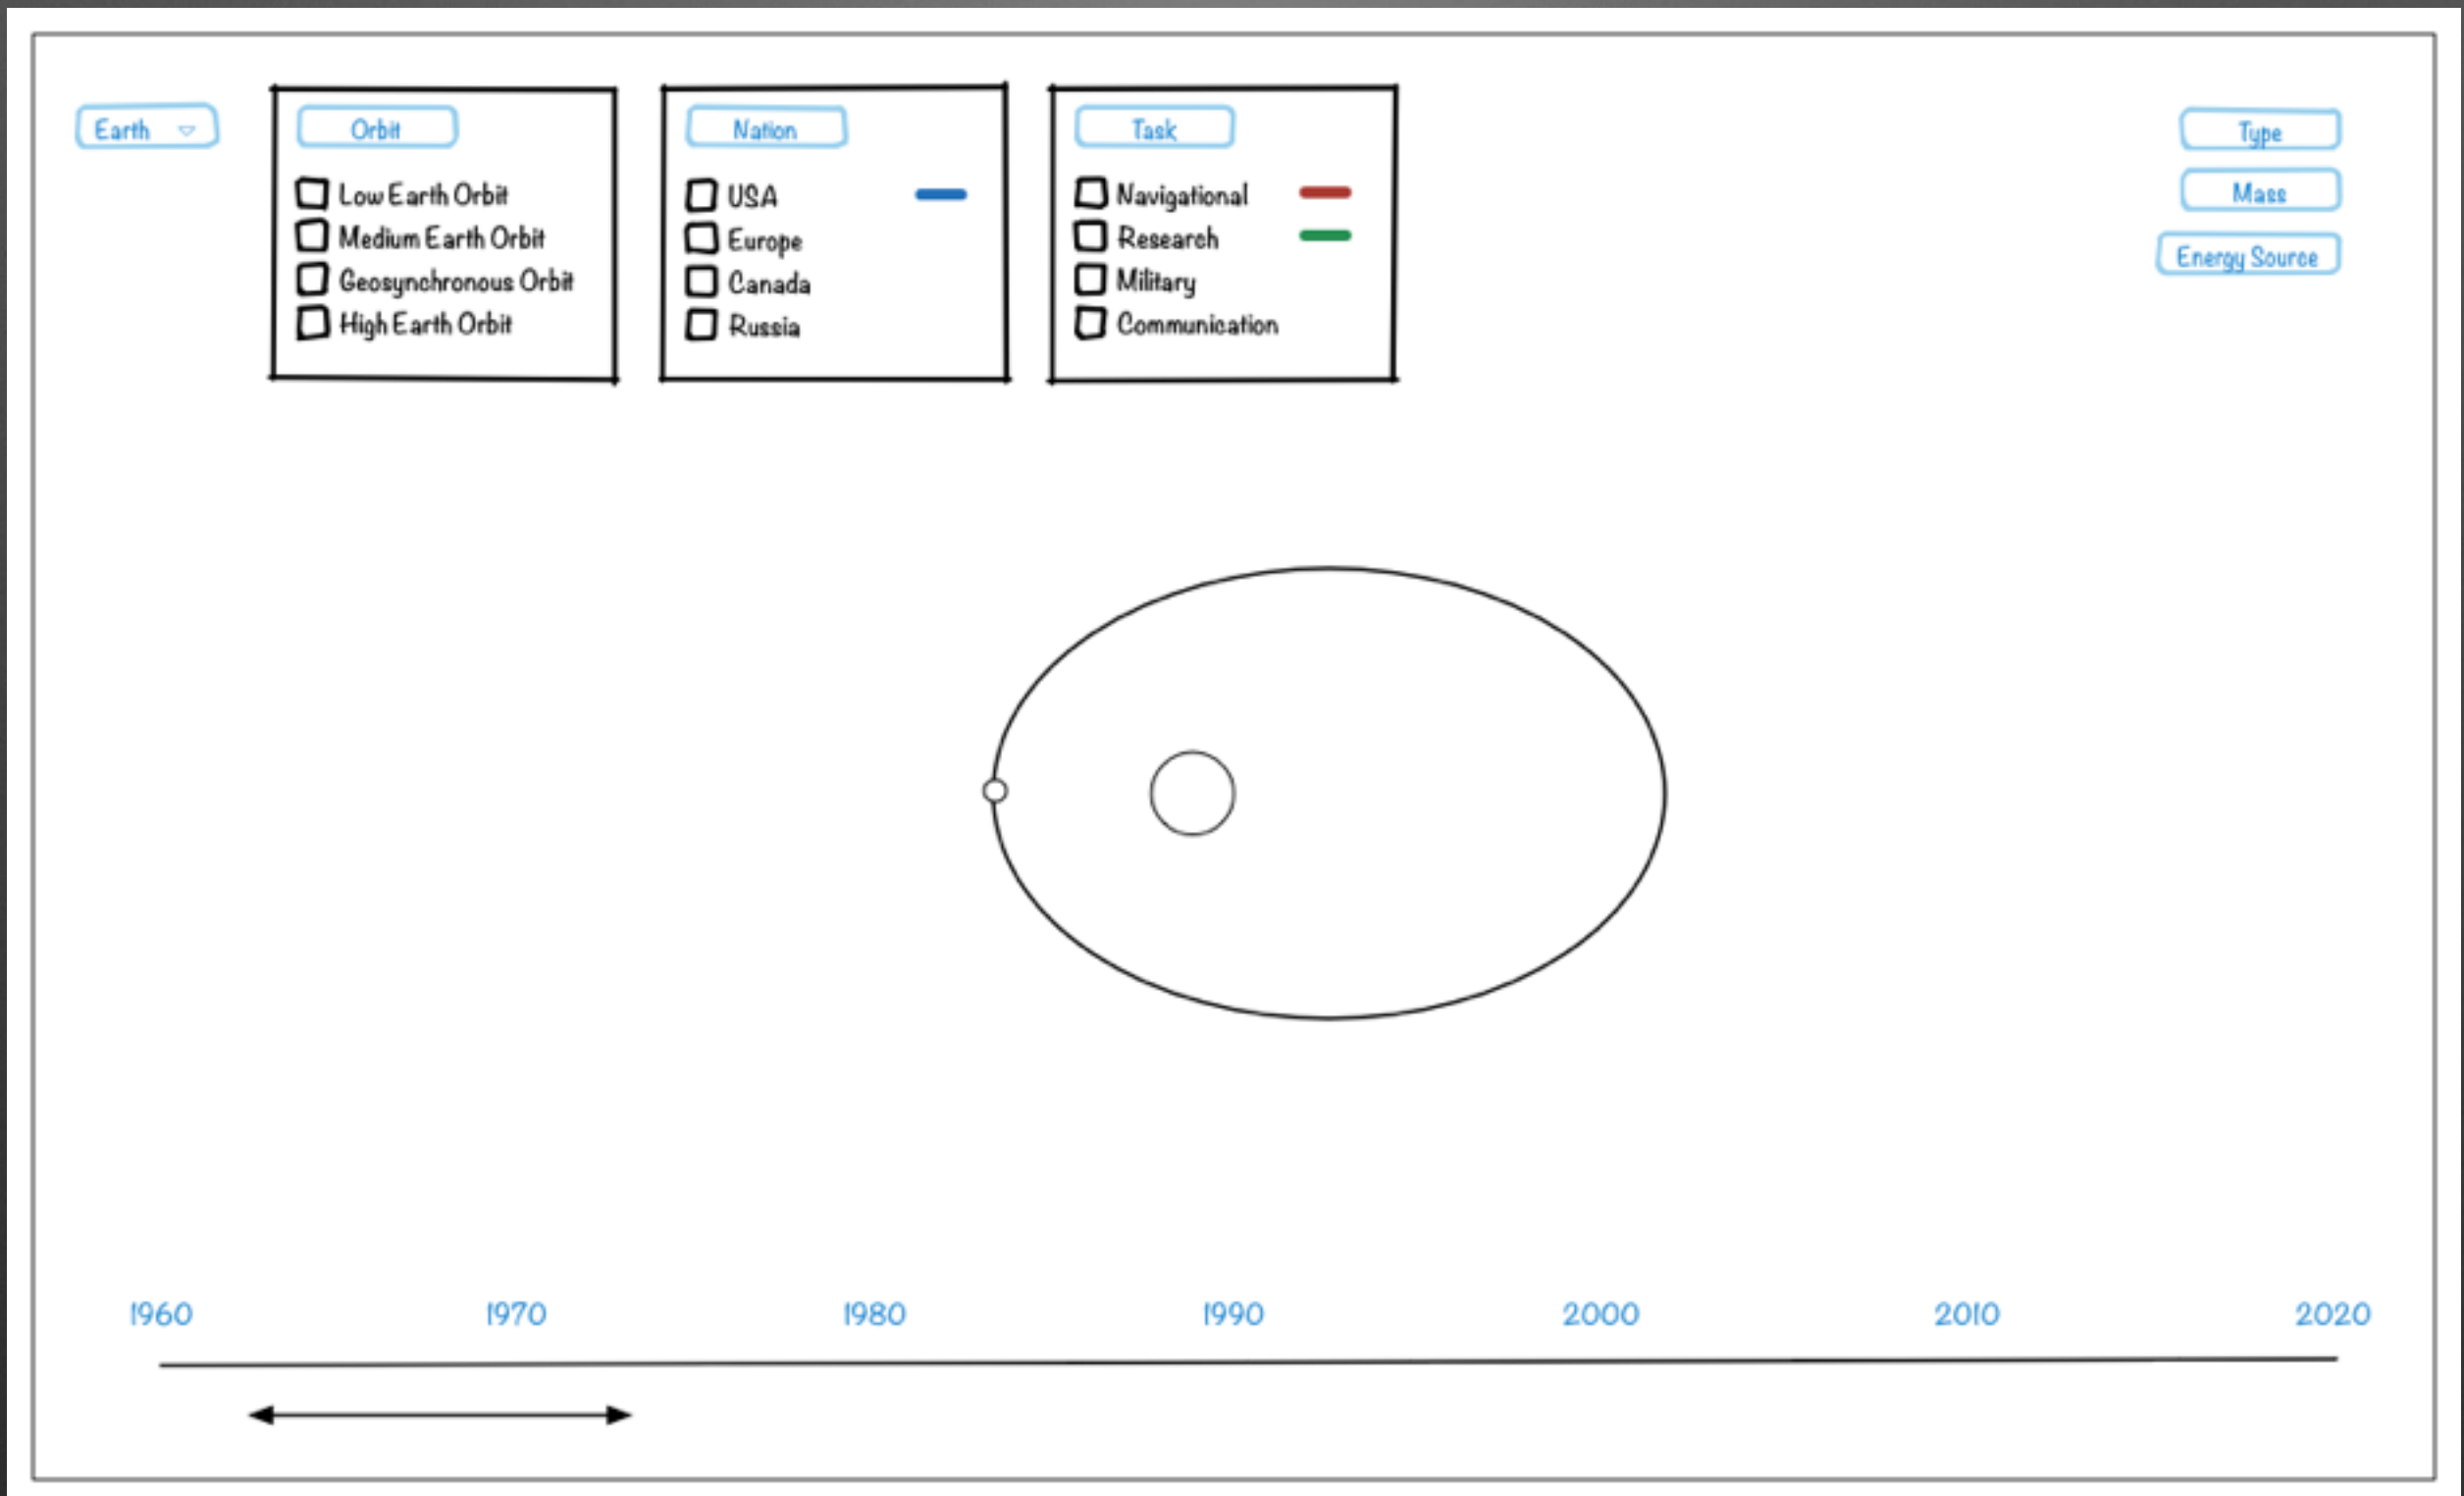

Technologies

- JavaScript, WebGL, THREE.JS 3D Engine
- Python as BackEnd for data access and position calculation
- JSON as data exchange and storage format

Extended Concept

- User configurable filter and color coding to highlight data of users interest
- Overlay of additional information
- Custom data format to store orbit information (TLEs) and additional properties for filtering
- Data Aggregators for updating Database with current Orbit Data and other information

Extended Concept

Approach for an Real World Application

- Client requests data within certain **timeframe** and for a **region of interest** from server
- Client filters the data further depending on made selections
- **Orbit** and **Position Calculations** can be done in JavaScript which would eliminate communication overhead

Thank you!
